

BCC Affirmatic for Microsoft 365

Sovereign Governance – Built for the Copilot Era

www.bcchub.com

Who still has access to your Microsoft 365?

External guests, partners, and contractors accumulate silently in every Microsoft 365 tenant. Most organizations can't answer who has access, why, or for how long. **Result: stale access piles up, attack surface grows, and Copilot starts surfacing data to people who should have been off-boarded years ago.** BCC Affirmatic is the specialist governance platform for external identities - purpose-built for compliance-sensitive enterprises, ready for the era of AI-powered collaboration.

THE CHALLENGE

A typical scenario: A consulting firm is brought in for an 8-week project. Three years later, their Entra ID guest accounts are still active - with read access to project SharePoint sites, archived Teams channels, and shared documents. **No one owns the off-boarding decision. No one even remembers they're there.** Multiply this by hundreds of external relationships, and the result is a quiet, growing governance gap that no native M365 control was designed to close. **BCC Affirmatic was.**

Six reasons organizations choose BCC Affirmatic.

Built for the full Guest User Lifecycle Affirmatic was architected from day one around the external identity lifecycle - NDA capture at invite, time-bound access, owner attestations, one-click removal. Not a checkbox on a feature list; a specialisation.	Business Ownership Model Generic tools put IT in charge of governance. Affirmatic pushes accountability to where the relationship lives: named business owners, delegated approval chains, scheduled recertifications. IT sets the guardrails; the business runs the relationship.	Audit-Ready by Design Every action - invite, approval, extension, removal - is captured with actor, timestamp, and rationale. Auditors don't ask "do you have a policy?" They ask "can you prove it?" Affirmatic answers out of the box.
Copilot Oversharing Prevention Unmanaged guest access is the #1 Copilot oversharing risk. Affirmatic is the natural governance control plane for AI rollouts - ensuring Copilot doesn't surface sensitive data to external users who should have been off-boarded 18 months ago.	Flexible Deployment SaaS on BCC-hosted Azure, private cloud, or dedicated VM. Regulated industries don't need to send governance data to a shared tenant - finance, healthcare, and public sector choose Affirmatic because deployment flexibility is real, not theoretical.	Multi-Tenant & MSP Native Manage multiple Microsoft 365 tenants from a single pane of glass with per-tenant policies. Designed for enterprise scale and the governance layer of choice for MSPs, global organizations, and BCC's own consulting practice.

HOW IT WORKS

Onboard. Govern. Recertify. Off-board.

1	2	3	4
Onboard with Context	Govern Continuously	Recertify on Cadence	Off-Board on Schedule
External identities enter through a guided invite flow with NDA capture, named business owner, expiry date, and access scope - not a one-click guest invite that vanishes into Entra ID.	Every guest has a named owner who receives scheduled review prompts . Time-bound access auto-expires and inactive accounts are flagged. The dashboard shows tenant-wide guest health at a glance.	Quarterly or custom reviews run automatically - Owners confirm, IT enforces. If an attestation lapses, access is removed immediately . No exceptions that quietly turn permanent.	End of project, end of contract: access ends. One-click removal across SharePoint, Teams, OneDrive, and Entra ID - with full audit trail of what was removed, when, and by whom.
